### About This Portal

This is a professional service booking platform for managing and scheduling services.

#### SERVER-SIDE ENGINEERING FUNDAMENTALS

Your backend is built using Node.js, Express.js, and MongoDB, applying key server-side concepts such as:

##### 1. Server & Framework: Node.js with Express.js

Node.js is a JavaScript runtime used for building scalable, event-driven servers.

Express.js is a lightweight web application framework for Node.js that simplifies routing and middleware management.

*Key concepts used:* Middleware functions for parsing request bodies and handling errors. Routing to define API endpoints like /services, /bookings, /providers. Controllers to separate logic from route definitions.

##### 2. RESTful API Architecture

Your backend exposes RESTful API endpoints, which means:

- Stateless interactions: Each request is independent.
- HTTP methods:
  - GET → fetch data (services/bookings/providers)
  - POST → create new entries (add service, book a service)
  - PATCH → update existing data (e.g., update booking status)

## 2. RESTful API Architecture

Your backend exposes RESTful API endpoints, which means:

- Stateless interactions: Each request is independent.
- HTTP methods:
  - GET → fetch data (services/bookings/providers)
  - POST → create new entries (add service, book a service)
  - PATCH → update existing data (e.g., update booking status)
  - DELETE (optional) → remove data (future scope)

## 3. MongoDB (NoSQL Database)

MongoDB stores data as documents (JSON-like format) inside collections.

*Used collections:* services, bookings, providers.

*Features:* Schema-less structure, optional Mongoose ODM.

## 4. Modular Architecture

*Folder structure:*

- routes/: API route definitions
- controllers/: Business logic
- models/: MongoDB schemas
- config/db.js: MongoDB connection logic

## 5. Database Connection Handling

Async connection to MongoDB with reusable instance setup.

## 6. Validation & Error Handling

Input validation (e.g., required fields), async error catching, user-friendly frontend messages.

## 7. Cross-Origin Resource Sharing (CORS)

Enables frontend-backend communication using cors middleware.

## 8. Port & Server Initialization

Backend listens on a specific port using app.listen and logs success messages.

## 9. Security (Basic Level)

Simple admin passcode check. No advanced authentication implemented yet.

## 10. Scalability Considerations

Modular code enables future enhancements like user auth, service categories, deployment to production-grade infrastructure.

# Database [Bookings]

```
_id: ObjectId('6857ea9c304b8c872157715e')
customerName : "Priya Anand"
phone : "9123456780"
